

ADJUSTABLE HAND REAMERS

- Adjustable hand reamers are commonly used in machine shops, maintenance facilities, and other metalworking environments where precision hole sizing is crucial. They are suitable for a variety of materials, including metals, plastics, and composites.
- Blades are Manufactured in High Carbon Steel & HSS (As per Order)
- Adjustable hand reamers typically have multiple blades that can be adjusted simultaneously to maintain a centered cut. The number of blades can vary, but three or four blades are common.
- The key feature of adjustable hand reamers is their ability to change the diameter. This is usually achieved by loosening a nut on the reamer and then turning an adjustment screw to move the blades in or out.
